Red-spotted Purple

The Sky Tells a Story: The new moon is June 12th, with the waxing crescent moon passing by brilliant Venus on June 15th, then below Mars on June 17th. The first quarter moon is June 19th, with the full moon on June 26th. This is the Strawberry Moon; the name is universal to every Algonquin tribe because the relatively short season for harvesting strawberries comes each year during the month of June. The beginning of summer occurs at 6:29 AM CDT on June 21, the longest day of the year, with about 14 hours of daylight for the Gulf Coast. The brightest planet now in the evening sky is Venus, dominating the western sky. Mars is also overhead in the evening sky. It moves from Cancer into Leo in June, and passes just a degree north of Regulus, the brightest star of Leo, on June 7th. High up in the southern sky is Saturn, now in the arms of Virgo. To the east, Hercules is rising. The brightest star of the northern hemisphere, Vega, rises in the NE as twilight deepens. Twice as hot as our Sun, it appears blue-white, like most bright stars.

Plus the Usual: Handouts Gone Wild!! / RT Spirit Stick / Ticket Drawing / Closing
